

The Cellular Pathology of Disease and Its Resolution

– Dr. Thomas Levy

All chronic disease is a manifestation of various combinations of oxidized biomolecules, and that all toxins inflict their toxicity by causing such oxidation of biomolecules.

Therefore, therapies which utilise reduction/oxidation (redox) chemistry, as it relates to disease, is very effective. But what are these treatments?

Come and understand the pivotal role of increased intracellular oxidative stress (increased IOS) in all diseases, what the most common sources of ongoing oxidative stress in the body are, the principles of sound supplementation, and the role of vitamin C as a foundational supplement for maintaining and regaining good health.
